

TECHNOLOGY PARTNERSHIP

Irisity

Company Background

Irisity is a Swedish technology company specialising in AI-driven video analytics. Their software is designed to turn standard security cameras into intelligent detection systems, helping organisations respond more effectively to real-world events - without compromising on privacy.

Used by organisations across transport, critical infrastructure, public space and commercial environments, Irisity's solutions are known for being reliable, straightforward to deploy and easy to scale. Whether supporting a single site or a large, multi-location operation, the platform is built to adapt as requirements change.

IRIS+™ is Irisity's open video analytics platform, developed to support the practical rollout of AI at scale. Because it works independently of camera brand, customers can build on existing infrastructure rather than starting from scratch, making upgrades simpler and more cost-effective.

Partnership Highlights

AI Optimisation

Hardware platforms optimised for AI video analytics workloads

Camera Agnostic

An open, camera-agnostic approach that supports mixed and legacy estates

Scalable Solutions

Scalable solutions suited to both small and complex deployments

Excellent Customer Support

Clear communication and joint support from two experienced teams

Partnership with Secure Logiq

Secure Logiq and Irisity work closely together to deliver hardware and software solutions that are properly aligned from the outset. Secure Logiq understands the technical requirements of AI-based video analytics and provides hardware platforms that are optimised to support IRIS+™ in real-world deployments.

The result is a joined-up approach that helps organisations protect people and assets while supporting day-to-day operational needs. By combining intelligent analytics with purpose-built infrastructure, the partnership enables AI to support human decision-making — helping teams focus on what matters, when it matters.

Technology Partnership Agreement

IRIS+™ is an open platform for AI video analytics and is compatible with a wide range of camera brands and models. This gives customers and system integrators the freedom to combine older cameras with new technologies, without being tied to a single manufacturer.

This partnership confirms collaboration between Secure Logiq and Irisity to deliver integrated hardware and software solutions. Both companies work together on system design, optimisation, deployment and ongoing support to ensure solutions perform reliably and deliver long-term value.

Looking ahead

As organisations continue to adopt AI across security and surveillance environments, Secure Logiq and Irisity remain committed to working together on practical, dependable solutions. The focus is on supporting IRIS+™ deployments that are robust, scalable and fit for purpose.
